

Method	Description	Example Usage
<code>read(size)</code>	Reads and returns the specified number of characters/bytes from the file. If size is omitted or negative, it reads the entire file.	<code>content = file.read()</code>
<code>readline(size)</code>	Reads and returns one line from the file. If size is specified, it returns that maximum number of characters from the line.	<code>line = file.readline()</code>
<code>readlines(hint)</code>	Reads all remaining lines from the file and returns them as a list of strings.	<code>all_lines = file.readlines()</code>
<code>write(string)</code>	Writes a string to the file and returns the number of characters written.	<code>file.write("New song\n")</code>
<code>writelines(iterable)</code>	Writes a list of strings (or any iterable sequence) to the file. It does not automatically add line breaks.	<code>file.writelines(["Line 1\n", "Line 2\n"])</code>
<code>seek(offset, whence)</code>	Changes the current file position (cursor) to a new location. offset is the number of bytes, and whence defines the reference point (0: start, 1: current, 2: end).	<code>file.seek(0) # Go back to start</code>
<code>tell()</code>	Returns an integer representing the current position of the file pointer (cursor) measured in bytes from the start.	<code>position = file.tell()</code>
<code>flush()</code>	Flushes the internal buffer, forcing any buffered output to be physically written to the disk immediately without closing the file.	<code>file.flush()</code>
<code>fileno()</code>	Returns the integer file descriptor (a low-level handle used by the operating system) for the file.	<code>fd = file.fileno()</code>
<code>isatty()</code>	Returns True if the file stream is connected to a terminal device (interactive console), otherwise returns False.	<code>if file.isatty():</code>
<code>readable()</code>	Returns True if the file stream can be read from (opened with 'r', 'r+', etc.).	<code>if file.readable():</code>
<code>writable()</code>	Returns True if the file stream can be written to (opened with 'w', 'a', 'r+', etc.).	<code>if file.writable():</code>
<code>seekable()</code>	Returns True if the file stream supports random access (like <code>seek()</code> and <code>tell()</code>).	<code>if file.seekable():</code>
<code>truncate(size)</code>	Resizes the file to the specified number of bytes. If size is not specified, it truncates the file to the current cursor position.	<code>file.truncate(100)</code>
<code>close()</code>	Closes the file stream. Once a file is closed, you cannot read or write to it anymore. (Automatically handled if using <code>with open()</code>).	<code>file.close()</code>
